2 Introduction

Mellanox hw-management package uses a virtual file system provided by the Linux kernel called sysfs.

The sysfs file system enumerates the devices and buses attached to the system in a file system hierarchy that can be accessed from the user space.

The major advantage of working with sysfs is that it makes HW hierarchy easy to understand and control without having to learn about HW component location and the buses through which they are connected.

2.1 Software Components

Figure 1 presents the software architecture layout and Figure 2 presents layer separation for sysfs support.

Figure 1 - System Architecture Layout

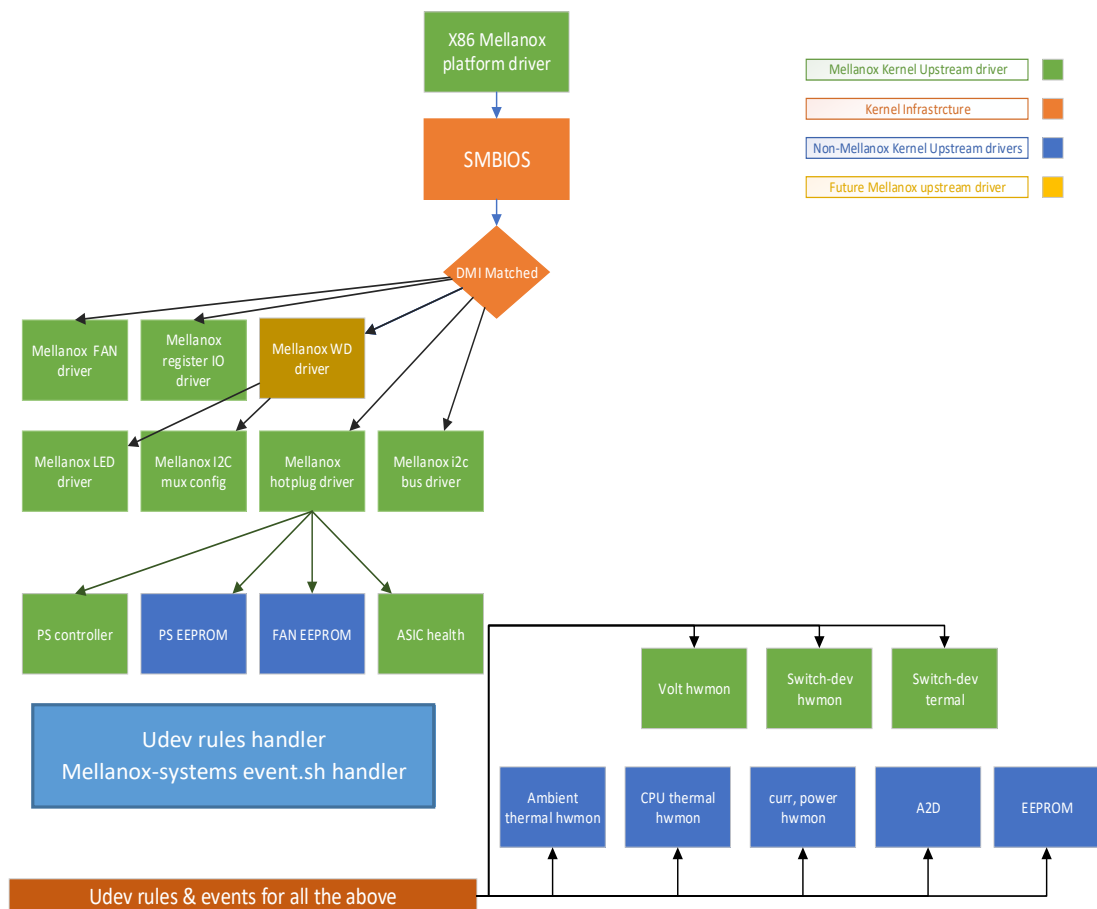

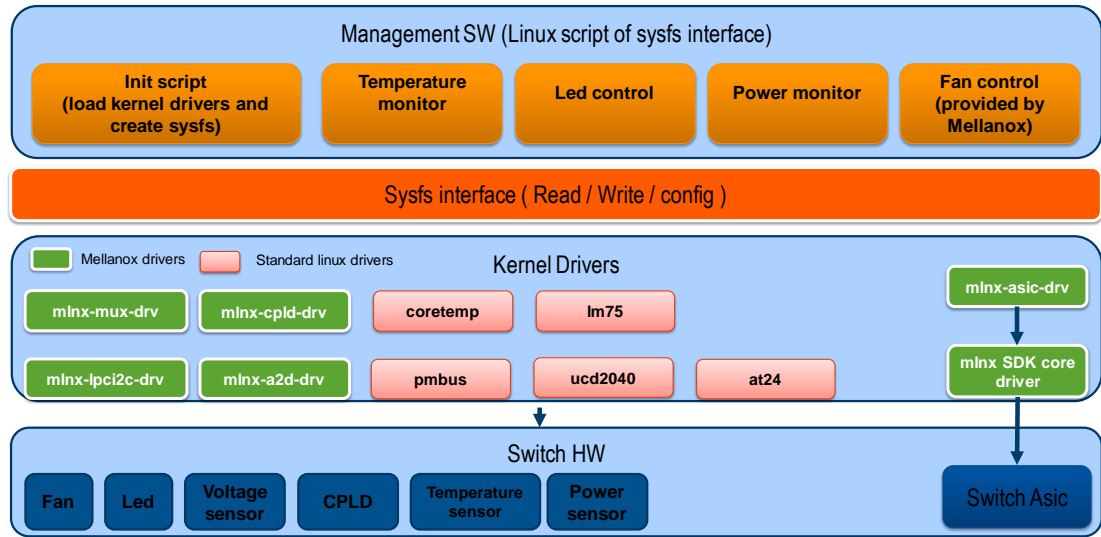

Figure 2 - Sysfs Layout

2.2 Hierarchy and Structure

The package uses the Linux default hierarchy structure of sysfs under the directory `/var/run/hw-management`.

This path is used by existing applications that use auto-discovery to find existing HW components. Two examples for such applications are:

- ▶ `libsfs` – the libraries provide a consistent and stable interface for querying system device information exposed through sysfs.
- ▶ `systool` – a utility built upon `libsfs` that lists devices by bus, class, and topology.

The disadvantage of using this path is that the hierarchy model includes the BUS type and location model which is subject to change between different system types.

To resolve this limitation, the virtual hierarchy structure that is not HW dependent is supported. This hierarchy is a collection of soft links to the default sysfs structure. This document describes the way to work with this hierarchy in order to control the HW.

Chassis attributes information exported through sysfs can be utilized by a number of standard Linux tools. So, for example, the following are tools from the Linux packages `lm-sensors` and `fancontrol`, which are capable of operating on top of sysfs infrastructure:

- ▶ `pwmconfig` – tests the pulse width modulation (PWM) outputs of sensors and configures `fancontrol`
- ▶ `fancontrol` – automated software-based fan speed regulation
- ▶ `sensors` – print sensors information

2.3 Sysfs Initialization and Driver Registration

As describe in the previous sections, sysfs structure provide access to HW drivers. These drivers need to be initialized before using sysfs. In addition, Mellanox virtual hierarchy also needs to be created in order to use it.

The package provides a simple way to initialize the drivers using the set of the shell scripts. These scripts support initialization and de-initialization of driver, virtual hierarchy structure, udev events handling, based on a set of Mellanox system specific udev rules.

Package contains the following files, used within the workload:

- ▶ `/lib/systemd/system/hw-management.service`: system entries for thermal control activation and de-activation.
- ▶ `/lib/udev/rules.d/50-hw-management-events.rules`: udev rules defining the triggers on which events should be handled. When trigger is matched, rule data is to be passed to the event handler (see below file `/usr/bin/hw-management-events.sh`).
- ▶ `/usr/bin/hw-management-control.sh`: contains thermal algorithm implementation.
- ▶ `/usr/bin/hw-management-chassis-events.sh` and `/usr/bin/hw-management-thermal-events.sh`: handle udev triggers, according to the received data, it creates or destroys symbolic links to sysfs entries. It allows to create system independent entries and it allows thermal controls to work over this system independent model. Raises signal to `hw-management-control` in case of fast temperature decreasing. It could happen in case one or few very hot port cables have been removed. Sets PS units internal FAN speed to default value when unit is connected to power source.
- ▶ `/usr/bin/hw-management.sh`: performs initialization and de-initialization, detects the system type, connects thermal drivers according to the system topology, activates and deactivates thermal algorithm.
- ▶ `/usr/bin/hw-management-led-state-conversion.sh` and `/usr/bin/hw-management-power-helper.sh`: helper scripts.
- ▶ `/etc/modprobe.d/hw-management.conf` and `/etc/modules-load.d/hw-management-modules.conf`: configuration for kernel modules loading.

For more details follow package README file.

Mellanox watchdog device is implemented in a programmable logic device.

There are 2 types of HW watchdog implementations:

- ▶ Type 1 – actual HW timeout defined as a power of 2 msec. For example: Timeout 20 sec is rounded up to 32768 msec. The maximum timeout period is 32 sec (32768 msec). Get time-left is not supported.
- ▶ Type 2 – actual HW timeout defined in seconds and is the same as user-defined timeout. Maximum timeout is 255 sec. Get time-left is supported.

Type 1 HW watchdog implementation exists in old systems and all new systems have Type 2 HW watchdog. The two types of HW implementation also have a different register map.

Mellanox systems can have 2 watchdogs: Main and auxiliary. Main and auxiliary watchdog devices can be enabled together on the same system. There are several actions that can be defined in the watchdog: System reset, start fans on full speed, and increase register counter. The last 2 actions are performed without a system reset. Actions without reset are provided for the auxiliary watchdog device, which is optional.

Watchdog can be started during a probe. In this case it is pinged by the watchdog core before the watchdog device is opened by the user space application.

Watchdog can be initialized in using a nowayout method. That is, once started it cannot be stopped.

The mlx-wdt driver supports both HW watchdog implementations.

Watchdog driver is probed from the common mlx_platform driver. Mlx_platform driver provides an appropriate set of registers for Mellanox watchdog device, identity name (mlx-wdt-main or mlx-wdt-aux), initial timeout, performed action in expiration and configuration flags.

Watchdog configuration flags: nowayout and start_at_boot. HW watchdog version: type1 or type2. The driver checks during initialization if the previous system reset was done by the watchdog. If yes, it makes a notification about this event.

Access to HW registers is performed through a generic regmap interface.
